

Devon Yuan

+1 (236) 458-2221 | devon.yuan@outlook.com | [LinkedIn](#) | [GitHub](#) | [Personal Website](#)

TECHNICAL SKILLS

Languages | Go, Python, TypeScript/JavaScript, SQL, Java, C++, R
Frameworks | Golang-Migrate, Electron, TanStack Query, React/NextJS, TailwindCSS, Express.js, chi, FastAPI, Playwright
Developer Tools and Operating Systems | Git, GitHub CLI, Docker, Visual Studio Code, pgAdmin4, Linux Mint, MacOS, Windows
Project Leadership | GitHub Issues, GitHub Projects, Branches, PR reviews, System Design/Architecture
AI | Prompt Engineering, APIs, Copilot, Claude Code, Cursor, Devin, Ollama, LM Studio

WORK EXPERIENCE

Innershell Solutions Corp.

Software Development Intern (Contract)

07/2026 – Present
Edmonton (Remote)

- Worked on [PerksWyse](#), a loyalty and payment platform for the plasma donation medical industry (life sciences).
- Rebuilt the backend, originally a no-code platform (Xano) using Go, resolving the proprietary lock-in of Xano.
- Ported 43 API endpoints and 14 database tables to the new platform with zero data loss.
- Containerized the backend using Docker Compose, streamlining end-user installation and deployment.
- Rebuilt and expanded the test suite to validate the migration, with 594 Playwright tests (192 API, 402 end-to-end).
- Enhanced the system with agentic features that allow end-users to configure complex rules and validate their configuration with their own API key and choice of models.
- Configured an AI coding agent on the codebase, developing agentic instructions to support ongoing development.

Project Lead Intern (Contract).

- Served as the project lead by drafting and implementing tickets with a detailed template, debugging the app, configuring agentic instructions, and following an "Impact Analysis" approach.
- Automated repetitive portions of the development workflow using GitHub CLI scripts, replacing repetitive manual GitHub operations with repeatable command-line processes, introducing a fully agentic workflow.
- Designed and implemented a GitHub App project aimed at reducing manual compliance overhead in regulated software development by embedding audit-trail and approval-gate capabilities directly into GitHub's Issue and PR workflows.
- Captures snapshots of GitHub issues and freezes the content to maintain accountability.

PROJECTS

CourseFlow | TypeScript, React, Electron

- Built a productivity app that ingests Canvas iCal feeds to centralize course deadlines and address the limitations of Canvas's built-in to-do list with more flexible task management.
- Completed the MVP with deadline sub-tasks, notes, progress tracking, and standalone notetaking, giving students more control over how they organize and track coursework.

Visualize Mechanics | FastAPI, React, 3Fiber, Electron

- Built a desktop application that processes basic physics questions and classifies them into a scenario, then produces a 3D rendering of the question.
- Includes a worked solution and a live variables tab to view variables of the question in real time.
- Allows users struggling to grasp basic physics concepts to understand the problems visually and view them from all angles.
- Uses BYOK with the NVIDIA NIM API (The choice of vision and reasoning models themselves were picked through several iterations to find the ideal balance between speed and intelligence).

OmniDrive – Unified Storage Pooler | FastAPI, React, Electron, SQLite

- Built a desktop application that unifies Google Drive and OneDrive into a single virtual filesystem, allowing users to browse and manage files across both providers through one interface.
- Remains functional even when Google Drive and OneDrive are still used independently, maximizing users' convenience.
- Integrated the Google Drive API and Microsoft Graph Files API into a FastAPI backend to authenticate with and perform file operations across two independent cloud storage systems.
- Designed a recursive virtual file system in backend memory and persisted file routing metadata in SQLite, translating provider-specific folder structures into a unified representation for the application.

Data Analysis Chatbot | FastAPI, React, PostgreSQL, Ollama

- Built a full-stack data analysis application using FastAPI and React that allows users to query datasets using natural-language prompts and receive programmatically generated analyses, effectively combatting hallucination.
- Integrated Gemini API to convert natural-language questions to Pandas code, then executed and captured the generated code's output against the user's dataset rather than relying on the LLM to perform numerical calculations directly.
- Implemented a cloud deployment architecture with FastAPI hosted on Railway, React hosted on Render, and PostgreSQL and object storage managed through Supabase, enabling the application to operate as a deployed web service.

EDUCATION

BSc. Major in Computer Science
The University of British Columbia

2030 (Anticipated)
Vancouver
